

C1 – Children living in low income

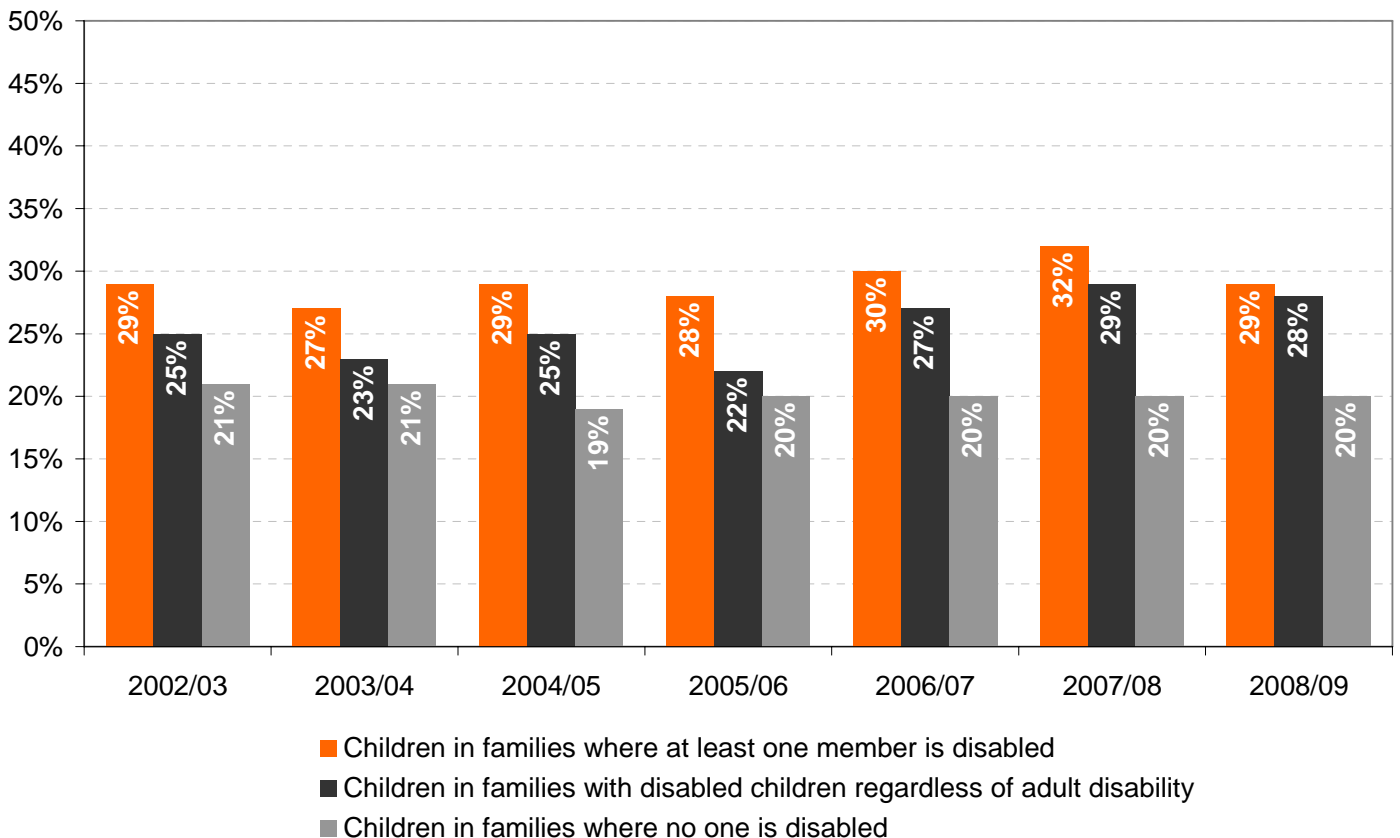

Baseline and Trends: Baseline year – 2004/05. Before Housing Costs, there has been no statistically significant change since the baseline registered through this indicator. After Housing Costs, the only significant changes registered between 2004/05 and 2008/09 have affected the percentage of children living in low income in families where no one is disabled, which increased from 26% to 28%, and the percentage of children living in low income in families with disabled children regardless of adult disability, which increased from 32% to 37%.

Before and After Housing Costs, there have been no statistically significant changes since 2007/08 registered through this indicator.

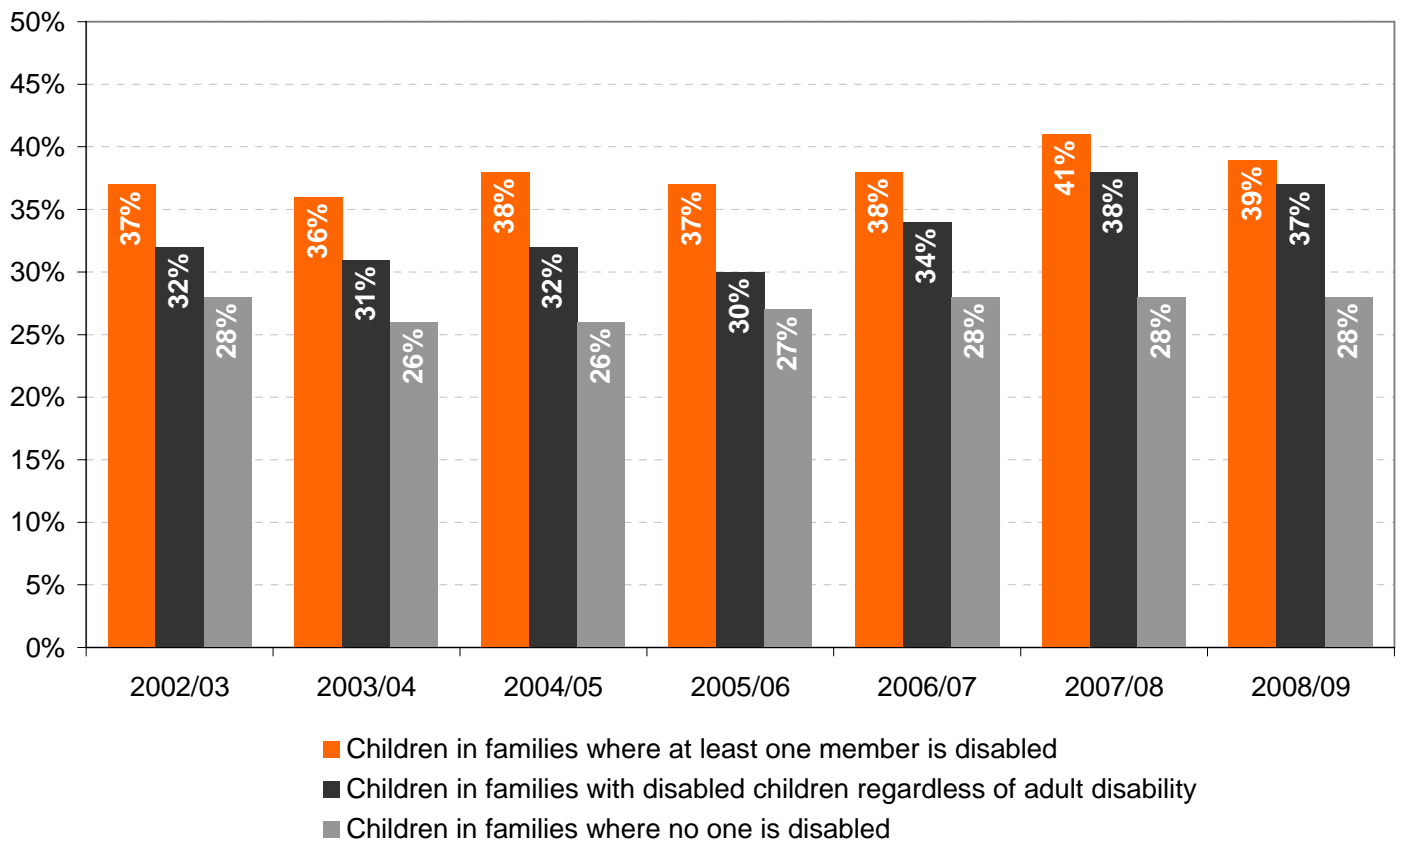

On both Before and After Housing Costs bases:

- the proportion of children in low income is significantly higher in families where at least one member is disabled than families where no one is disabled
- the proportion of children in low income is significantly higher in families where at least one child is disabled than families where no one is disabled
- there is no significant difference in the proportion of children in low income where at least one child is disabled and families where at least one member is disabled

Children living below 60% median equivalised household income Before Housing Costs

Children living below 60% median equivalised household income After Housing Costs

Definition: Disabled people are defined as respondents who report a limiting long standing illness, impairment or disability. Everyone in this group is likely to meet the definition of disability in the Disability Discrimination Act. Data is for United Kingdom.
